BUILD NORTH · 2026

AgentTrace

Rewind to any sub-agent, fix it,
and be confident that the fix works.

BUILT WITH

Claude · SurrealDB · Era by Eon · Clerk · Render

THE OPPORTUNITY

Agent systems aren't chains anymore. They're dense graphs.

1,445%

jump in companies asking about multi-agent systems, in about a year

14%

is how often the best AI method finds the exact step that broke an agent team.

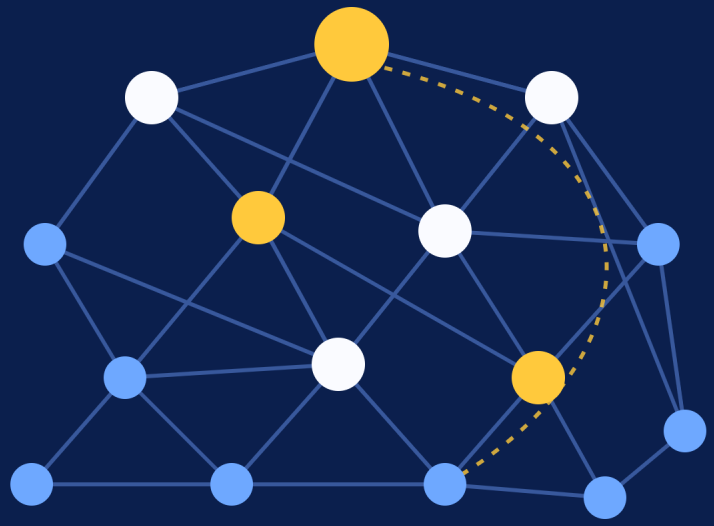

The guilty agent: 53.5%, a coin flip.

Then:
a chain

Now:
a dense graph

One question ripples through the whole web.

More links between agents. More places for one mistake to hide.

MEET OUR USER

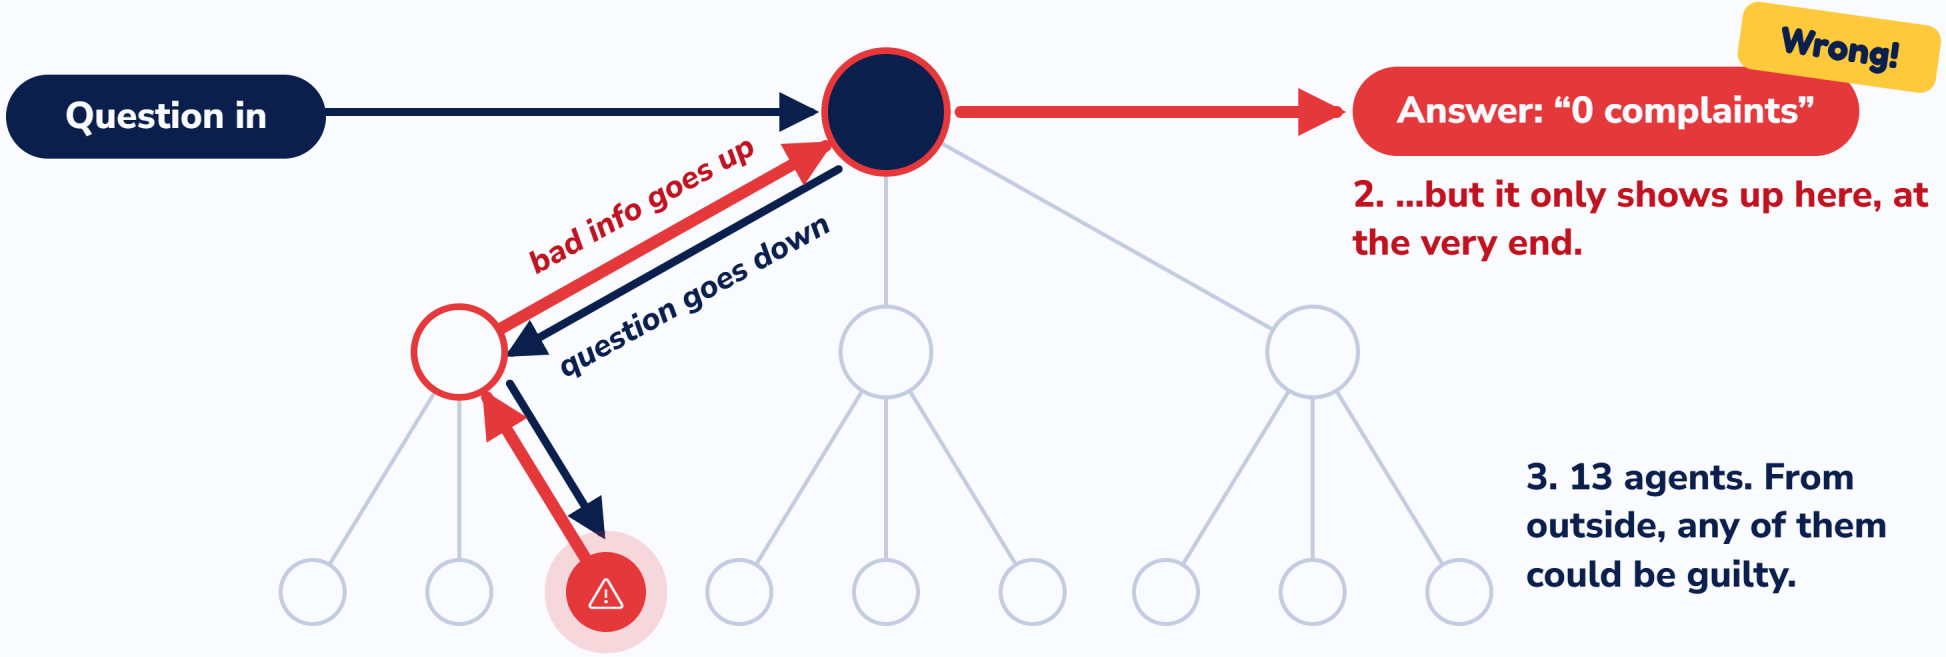

Sarah

AI engineer. Her team runs a web of AI agents.

> ***"When my agents get it wrong, I can't tell which one broke it."***

For the demo, we built Sarah's company with **Era by Eon**: its own Zendesk and Salesforce, full of realistic data.

One agent slips. Sarah's answer is wrong.

2. ...but it only shows up here, at the very end.

3. 13 agents. From outside, any of them could be guilty.

1. The mistake starts here, deep inside the team.

4. Every fix = re-run all 13 agents.
Hours and $$ for every try.

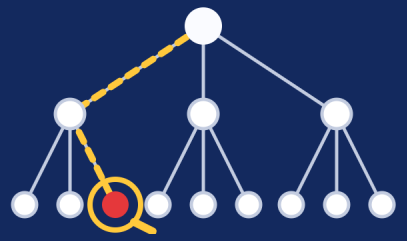

5. AI is a little random.
One lucky pass doesn't prove the fix worked.

SARAH MEETS AGENTTRACE

Find it. Fix it. Replay it. Check it.

Like a video-game save point: go back, change one move, play on.

1 Find it

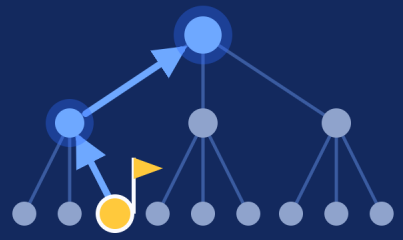

Claude traces the wrong answer back to the agent that caused it.

2 Fix it

Amend the state: change that agent's result, what it wrote for the next agent. Nothing else is touched.

3 Replay it

copied · $0 **runs live**

Rewind to that moment, load the fix, and the rest of the team plays for real: **8 times with the fix, 8 without.**

4 Check it

The final answer is checked against a real answer key from **Era**'s data. Not an AI's opinion.

Score: 0/8 → 8/8

The foundation: we record everything

- SurrealDB keeps a snapshot after every agent
- Clerk sign-in opens only your team's data
- Who read and who wrote what
- Secrets blanked out before they leave

Built with Claude · SurrealDB · Clerk · Era by Eon · Python SDK · FastAPI · Next.js

BACK TO SARAH

Problem solved.

With AgentTrace, Sarah can now:

- See exactly which agent broke the answer
- Edit just that agent's output
- **Replay everything before it instantly, at $0**
- Ship it with proof: 8/8

> *"I don't guess anymore. I test."*

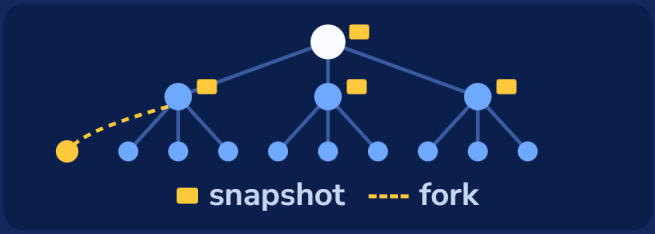

LIVE DEMO

Let’s fix Sarah’s failing run, live.

OUR PARTNERS

AgentTrace couldn't exist without them

SurrealDB

Replay needs saved state. Agent teams are graphs.

- ✓ Runs, steps, forks: **linked**, forks point to their parent
- ✓ **Snapshots** = replay save points
- ✓ **Agent Memory**: proven causes, per team

Clerk

Traces hold private data. Teams must never mix.

- ✓ Sign-in; **org = team workspace**
- ✓ Workspace from the **verified token** only
- ✓ **Roles**: admins delete runs, make keys

Era by Eon

A safe, fake company with a known right answer.

- ✓ Its **Zendesk + Salesforce** are where our agents work
- ✓ Same data = **exact answer key**, no AI judge
- ✓ Fix re-tested on 5 more customers: **0/15 → 13/15**

Anthropic Claude Haiku runs every demo agent and the root-cause detective

Render Hosts the website and the API, both from one blueprint

ONBOARDING

How user can plug in: 8 small steps

IN AGENTTRACE

1. Open “Connect your agents”
2. Create a run key
3. Create a fork key

IN YOUR PROJECT

```
# .env
AGENTTRACE_API_URL=
https://…
AGENTTRACE_INGEST_KEY=
at_live_…
```

4. Open your project
5. Add both keys to .env
6. Add our API URL

IN YOUR CODE

```
@node("planner")
async def planner(…):
@tool(side_effect=False)
async def search(…):
trace_run("my-agents")
```

7. Wrap your code with our library

One line above each agent and tool. Runs start flowing in.

EXTRA

8. Connect your slack with a webhook

Your code never leaves your computer. The fork key lets a small worker next to it ask us for jobs.

Thank you

Sarah stopped guessing. Your team can too.

TEAM Ajaypratap Gurmehak
